*JACC: Heart Failure 1:29-30, 2013*

"However, all is not so sanguine at the **intersection of AF and HFrEF**, which occurs commonly (5) due to overlap in their underlying pathophysiologies (6). "

# Pathophysiologies of AF and HFREF are similar

# What does AF add to ACM risk in CV disorders?

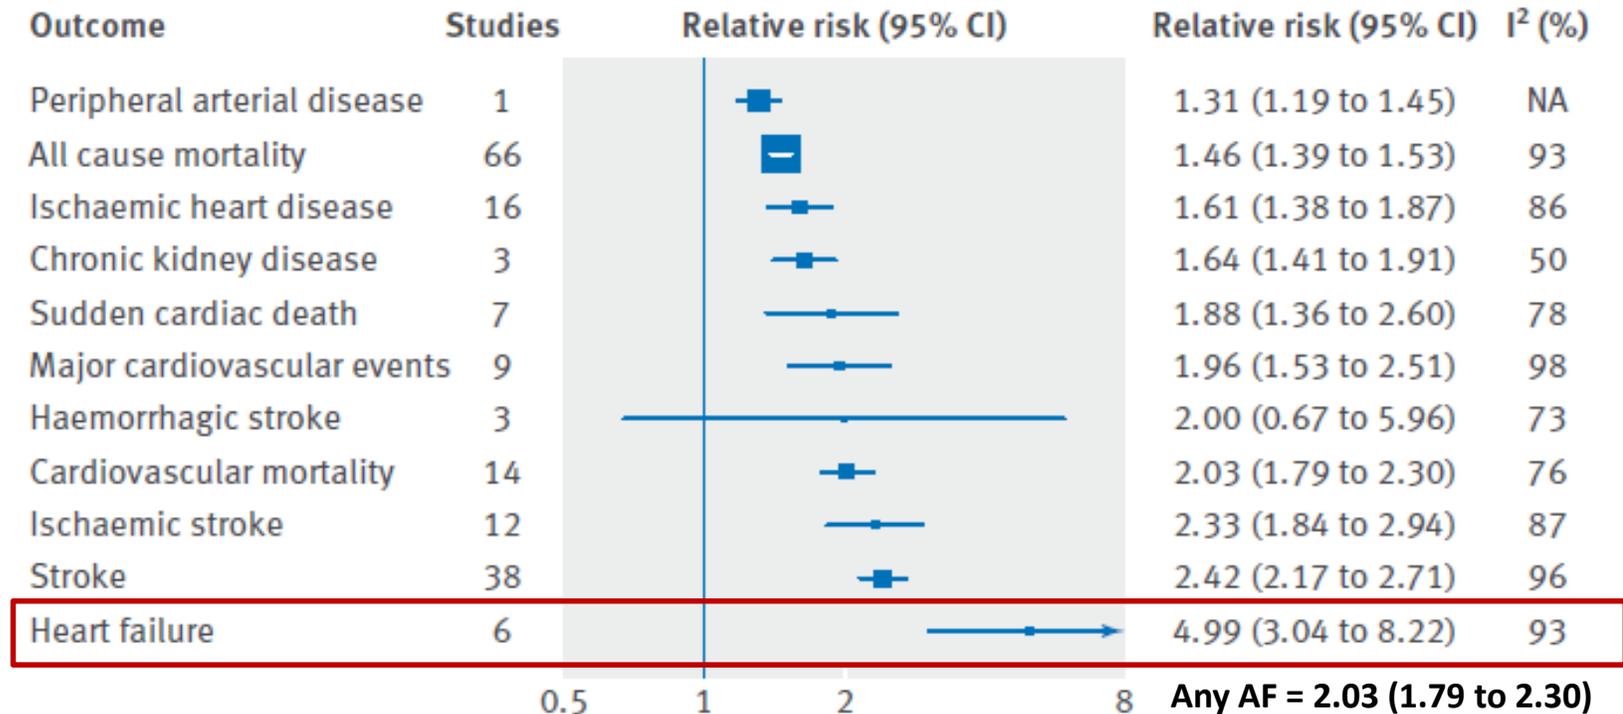

Fig 2 | Association between atrial fibrillation and all cause mortality and cardiovascular and renal disease, showing summary relative risks for each outcome examined. NA=not available

# What is the impact of AF in a HFrEF patient?

(Framingham, BEST trial data)

---

## Permanent AF

- Modest increases (1.5-1.6 fold) in all-cause mortality and hospitalization burden (days in hospital/patient).<sup>1</sup> **(However, this is a survivor analysis)**

## New Onset AF

- Increase (by ~ 2 fold) in all-cause and cause specific mortality<sup>1</sup>
  - Similar to 1.6 fold increase in Framingham new onset AF study in CHF<sup>2</sup>
- Marked increase (by ~ 6 fold) in hospitalization burden, after the onset<sup>1</sup>

## Conclusions

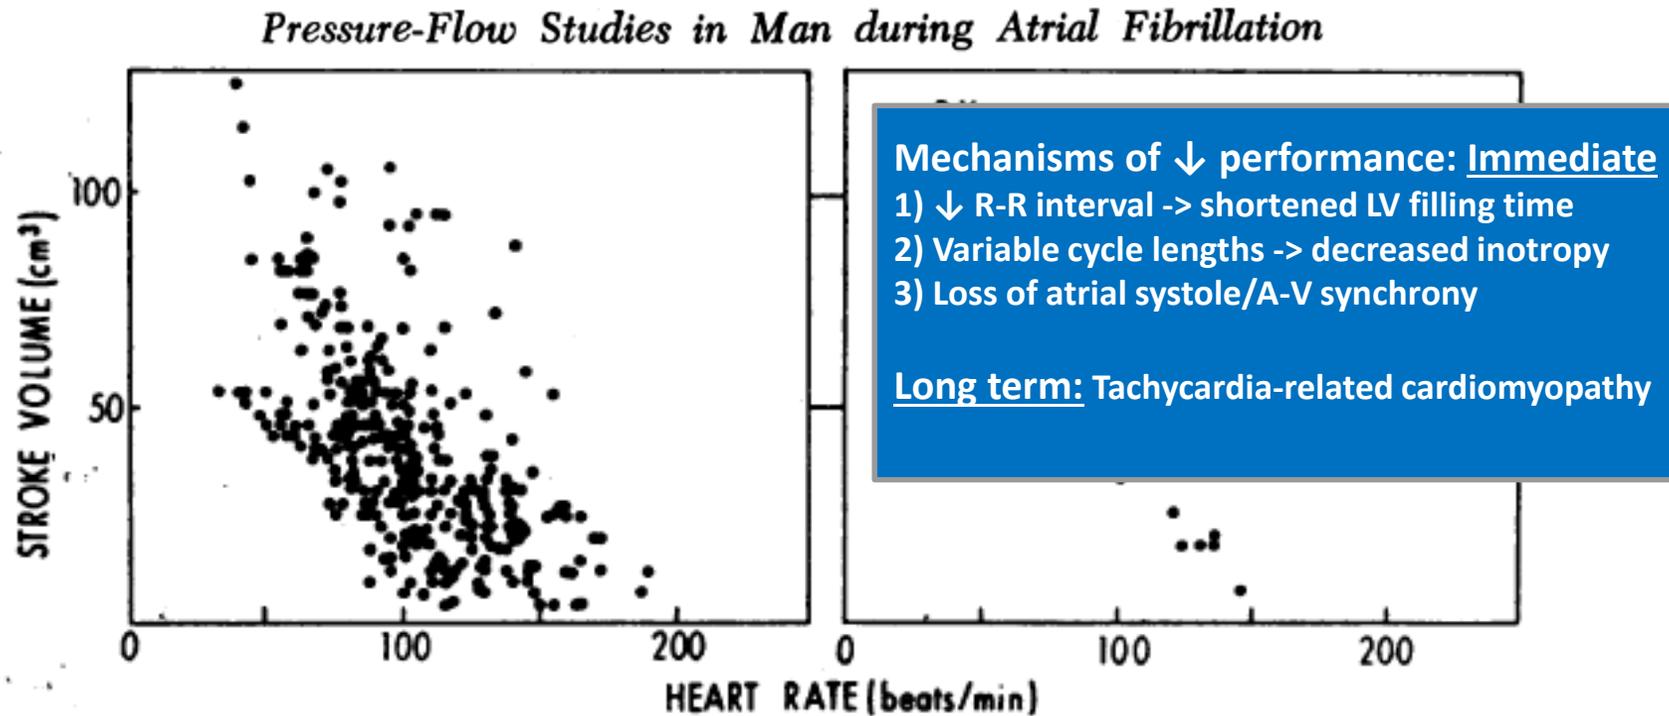

- New onset AF markedly increases HF morbidity and mortality
- For this and for stroke prevention reasons, in HFrEF patients AF should be aggressively prevented and treated → SR restored if it can be done *safely* with a reasonable chance of durability

$$RES = = (\ln 0.26 / \ln 0.59) = 2.55$$

$$Interaction\ p = 0.008$$

# GENETIC-AF: Phase 2B Genetically-Targeted Trial

(Piccini et al, JACC-HF in press)

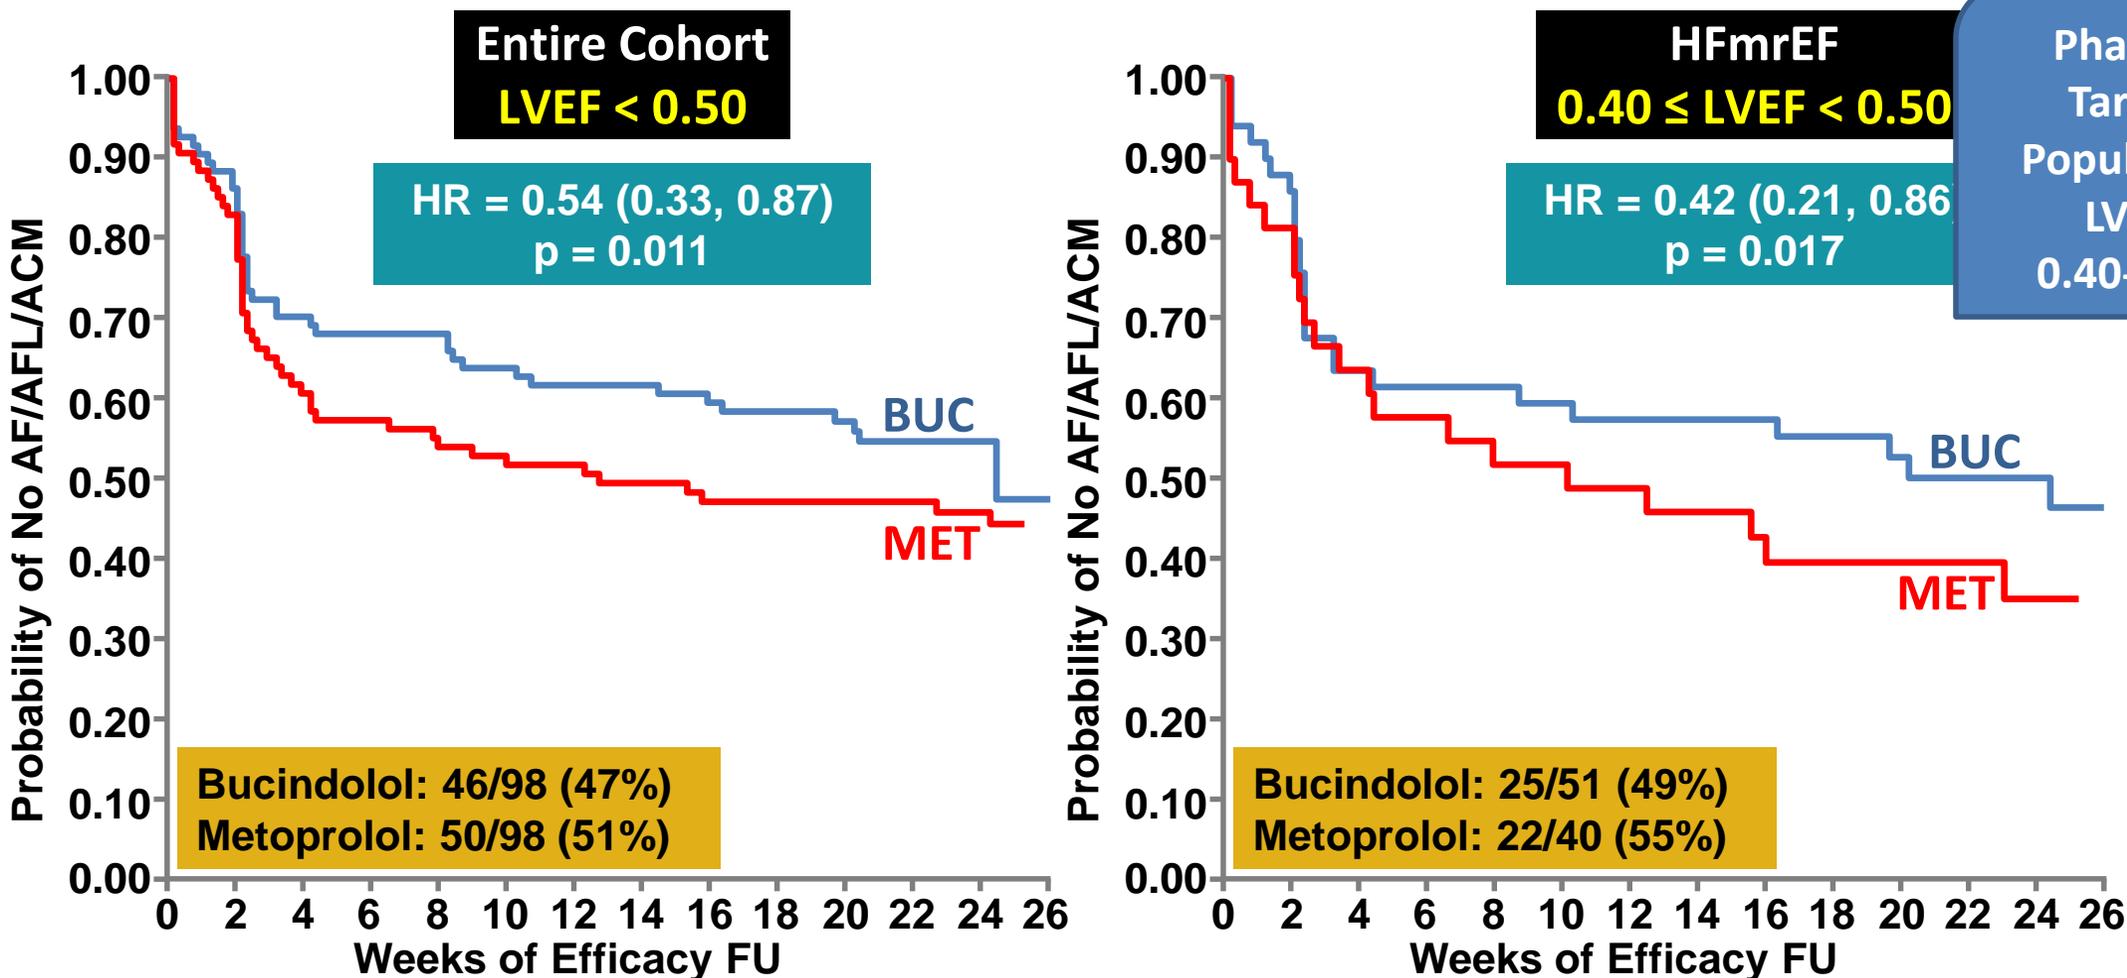

Time to AF/AFL/ACM – ECG based Detection

Cox proportional hazards model adjusted for the 4 randomization strata: 1) HF etiology, 2) LVEF, 3) rhythm at randomization 4) device type.

# GENETIC-AF: Time to AF/AFL/ACM

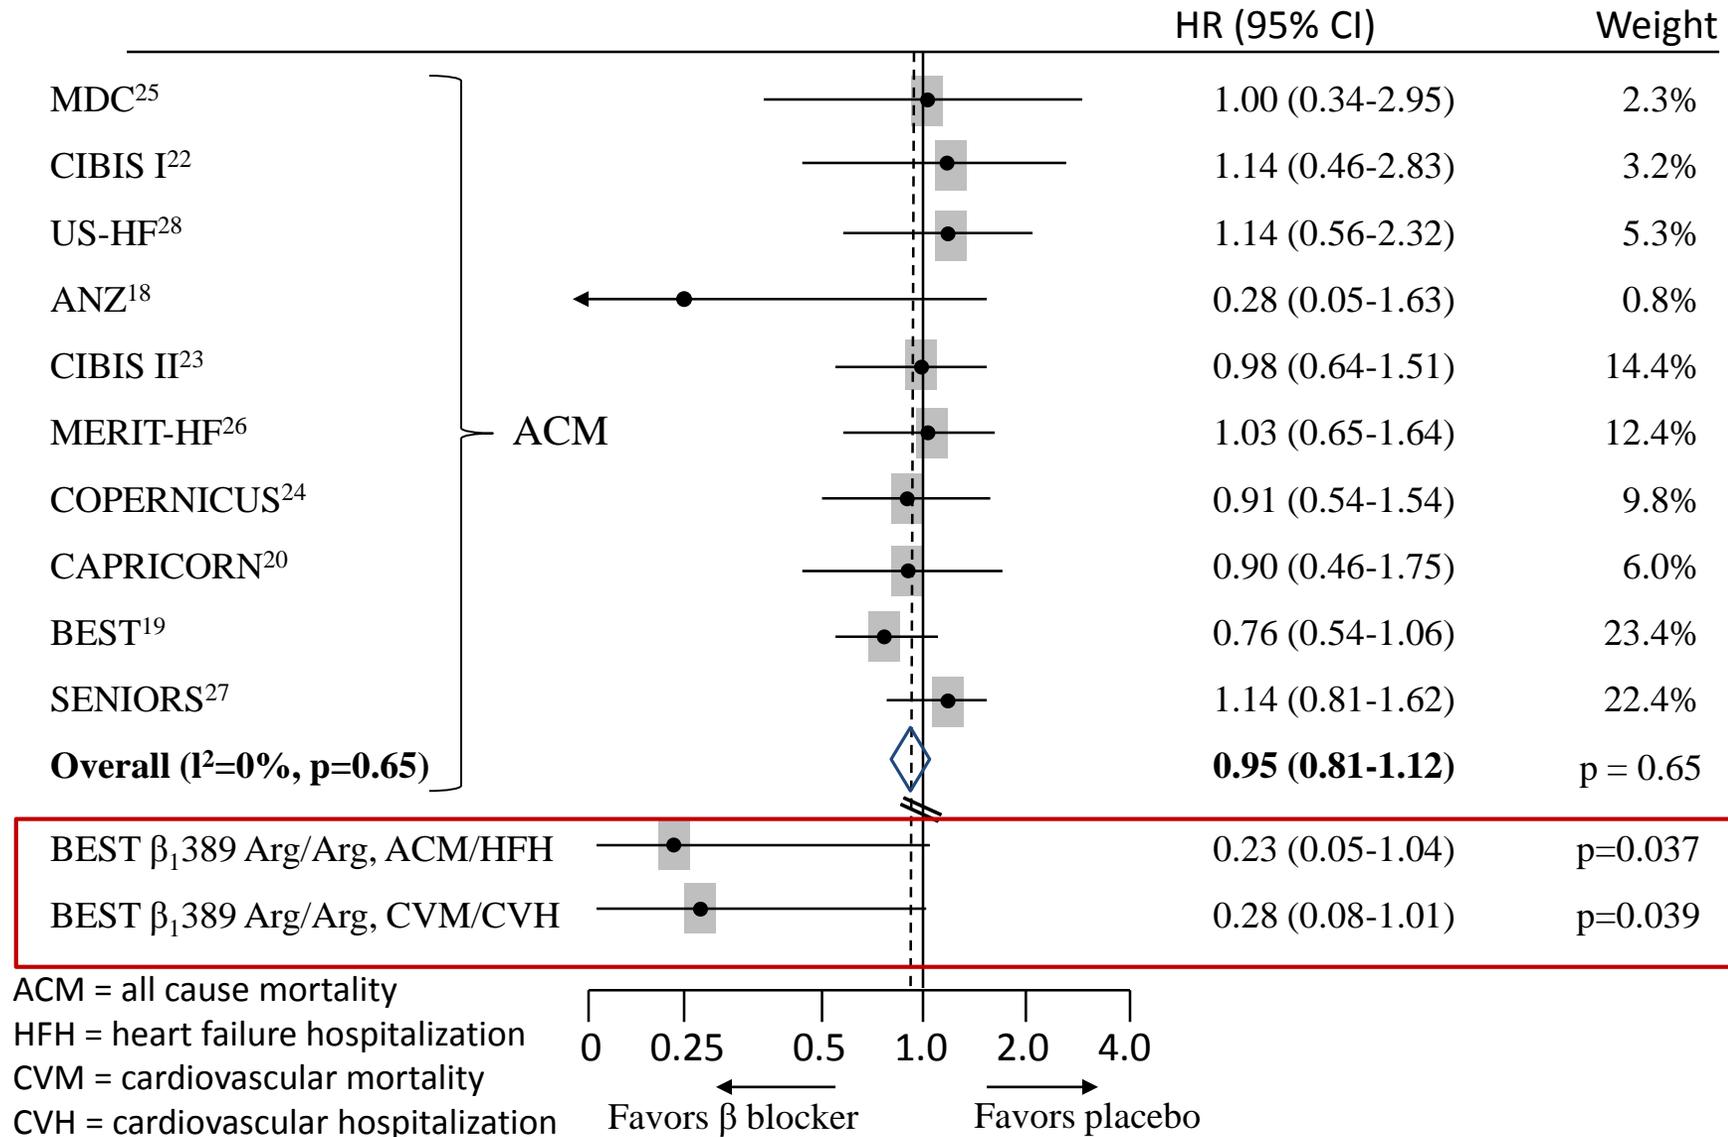

Excluding Pts with Long-standing (12/12+yrs) AF/HF Dx and AF Dx >2 years prior to HF Dx (Piccini et al, JACC-HF in press)

Cox proportional hazards model adjusted for: 1) HF etiology, 2) LVEF, 3) rhythm at randomization 4) device type, 5) Previous Class 3 AA use.

# β-blockers do not decrease HF endpoints in HFrEF patients in “permanent” AF (exception is bucindolol in β<sub>1</sub>389 Arg/Arg genotype)

Adapted from Kotecha D et al, Lancet 2014 and Kao D et al, EJHF 2013.

# Why should we care about AF in heart failure patients?

---

- Same reasons as in non-HF pts (stroke risk, Sx, ↓ Ex tolerance)
- AF is a marker for HF progression
- AF itself may worsen HF
- AF ablation in HFrEF extremely promising
  - but relatively high recurrence rate, drug therapy still needed
- Drugs used to prevent AF may worsen HF, are proarrhythmic
  - New drugs that prevent AF in HF or LVD pts are needed
- In permanent AF
  - Some rate control drugs may worsen HF or are proarrhythmic
  - AF pts at risk for tachycardia-related worsening of HF
  - Evidence suggests  $\beta$ -blockers ineffective for ↓ing HF events; emerging data suggests excessive HR lowering (e.g. to < mid 70s) may be adverse
